Can floating photovoltaics be used in lignite mines?

Commissioned by the renewable energy developer BayWa r.e., the Fraunhofer Institute of Solar Energy Systems ISE investigated the technical potential of floating photovoltaics (FPV) on pit lakes in former lignite mines in Germany.

Do open-pit mining patches have enough solar power?

The global open-pit mining patches possess sufficient solar electricity generation potential (EGP) to meet the projected demand for solar power outlined in the seven scenarios by 2050 of the EIA.

How reliable is a solar PV installation model?

The model's validation results showed excellent robustness, with an accuracy of 0.818, precision and recall both at 0.830, and an F1 score of 0.830. The installation probability values for solar PV span from 0 to 1, where higher values indicate a greater likelihood of installations.

Should PV systems be integrated with abandoned land in open-pit mines?

In this context, integrating PV systems with abandoned land in open-pit mines offers a mutually beneficial solution that can enhance land use while promoting renewable energy generation. This approach avoids encroaching on productive land and leverages the existing mining infrastructure.

A large advantage of FPV is its higher land-use efficiency (1.33 megawatt per hectare). The water on which the PV array floats also provides cooling which results in somewhat higher ...
