Will new wind & solar save energy costs in the EU?

Avoided fossil fuel import costs due to new wind and solar in the EU since 2019. The European Electricity Review analyses full-year electricity generation and demand data for 2024 in all EU-27 countries to understand the region's progress in transitioning from fossil fuels to clean electricity.

What if the EU didn't increase wind and solar power?

The increase in wind and solar generation in the EU also helped avoid EUR59bn in fossil-fuel imports over the past five years, Ember says. Without the increase in solar and wind capacity since 2019, the EU would have imported an extra 92bn cubic metres (bcm) of gas and 55m tonnes (Mt) of hard coal.

How has solar power changed in the EU?

Solar power output in the EU more than tripled between 2014 and 2024, the report shows, with last year seeing coal generation overtaken for the first time. Meanwhile, wind generation has more than doubled over the same period.

How has wind and solar impacted fossil-fuel production in the EU?

Wind and solar growth over the past decade pushed EU fossil-fuel generation in 2024 to its lowest level in 40 years, despite the long-term decline of nuclear power. The increase in wind and solar generation in the EU also helped avoid EUR59bn in fossil-fuel imports over the past five years, Ember says.

In 2025, wind and solar overtook fossil fuels in EU electricity, Ember found, with renewables supplying nearly half of total power generation across EU markets data.

For the first time in history, solar and wind have overtaken fossil fuels in the European Union's electricity mix - a milestone that signals far more than a change in power generation. It ...

(CN) -- The European Union is in a breakthrough moment: It's begun churning out more electricity from solar panels and wind turbines than power plants fed by coal and natural gas. The EU ...

Renewable energy sources include wind power, solar power (thermal, photovoltaic and concentrated), hydro power, tidal power, geothermal energy, ambient heat captured by heat pumps, biofuels and ...

Euro Wind and Solar Power

Over the past decade, coal power use in the European Union (EU) has fallen by 61%, according to Carbon Brief analysis of new figures from energy analysts Ember. Solar power output in ...

Wind power remained the EU's second largest power source, above gas and below nuclear. The significant progress has brought benefits beyond reducing emissions. Structural growth ...

Wind power and photovoltaic solar avoided EUR59 billion in fossil fuel imports since start of Green Deal In five years of the European Green Deal, a surge in wind and solar generation is the ...

Two decades ago, the European Union got basically none of its power from wind and solar. Now, those are the leading sources of electricity in the bloc. In 2025, wind and solar produced ...

The two renewable energy sources accounted for 30% of the EU electricity generation in the first half of 2024, energy think tank Ember said last week. -- Wind and solar energy made up a ...

Wind and solar have crossed a historic threshold. Together, they now account for 30% of total EU electricity generation, overtaking fossil fuels, which have fallen to 29%. When all renewable sources ...
