What size solar inverter do I Need?

Your inverter size should match your solar array's capacity, not your electricity bill. This means your inverter doesn't need to power your entire home--it just converts whatever your panels generate. Let's say you have a 6kW solar array (twenty 300-watt panels).

How much does a solar inverter cost?

On average, solar inverter installation costs range from \$1,500 to \$3,500, depending on system size, location, and complexity. Costs may be higher for battery-ready or hybrid systems. Matching your inverter to your solar panel output is crucial. Too many panels can overload the system; too few, and you're not maximizing potential.

How do I choose a solar inverter?

Panel-to-inverter distance: The farther your solar panels are from the inverter, the more careful your installer must be about voltage drop and wiring efficiency. Main service panel location and capacity: The inverter connects to your home's main electrical panel. An overloaded or outdated panel may need upgrades before installation can proceed.

How many solar panels can a solar inverter handle?

The number of panels a solar inverter can handle depends on its capacity and the total wattage of your solar array. This is determined by the DC-to-AC ratio, also known as the inverter loading ratio (ILR). o A 5 kW inverter can typically support 5.5 to 6.5 kW of solar panels.
