Does Chile have a strong energy transition?

The share of fossil fuel-based power increased to approximately 60% until 2014. Today the power system of Chile is more than double the size it was in 2014, with a 63% share of renewables. This is observed as a successful energy transition trajectory with the potential to continue advancing.

Does Chile have a national power system?

By 2013, several experimental wind and solar energy projects had been deployed in Chile. Since then, several studies have addressed the national power system through scenario analysis, .

What is the long-term outlook for Chile's electricity system?

Section 3. Our long-term outlook for Chile's electricity system focuses on technologies that are driving change in markets and business models, including solar PV, wind and storage. In addition, we highlight changing electricity demand and the growing role of consumers. Over the past decade, Chile has begun a rapid shift toward cleaner energy.

How is Chile transforming its energy system?

Section 1. Over the past decade, Chile has begun a rapid shift toward cleaner energy, aided by a liberalized power market and strong policy support. In the next three decades, the country's electricity system is expected to be transformed further, with lower- and lower-cost renewable resources gradually pushing out conventional power plants.
