Can MPC-LSTM-Kan improve energy management in high-altitude wind energy systems?

The successful implementation of the MPC-LSTM-KAN framework underscores its potential for improving energy management in high-altitude wind energy systems. The ability to predict future power outputs with high accuracy and incorporate these predictions into the MPC optimization process is crucial for maintaining system stability and efficiency.

How does a high-altitude wind energy work umbrella control system work?

The proposed method is applied to a high-altitude wind energy work umbrella control system, where it aims to enhance the stability and efficiency of energy utilization. The work umbrella system integrates wind and solar energy sources, with energy stored in a battery and used to control the umbrella's operations.

How can the Kolmogorov-Arnold network improve a high-altitude wind energy system?

Such an approach not only stabilizes the SOC but also enhances the overall efficiency and reliability of the high-altitude wind energy system. The Kolmogorov-Arnold Network (KAN) provides a powerful mathematical tool for approximating multidimensional continuous functions.

How can the integration of environmental data and environmental data improve energy management?

The integration of these two methods creates a robust approach to handling the variability and uncertainty inherent in renewable energy sources, thereby facilitating more efficient energy management. Table 1. Partial environmental data.
