Can batteries be used in photovoltaic panels?

However, there is a need to maximize the potential of solar panels and avoid wasting the excess solar energy that companies produce. The solution lies in integrating batteries into photovoltaic panel installations.

What is solar battery technology?

Solar battery technology stores the electrical energy generated when solar panels receive excess solar energy in the hours of the most remarkable solar radiation. Not all photovoltaic installations have batteries. Sometimes, it is preferable to supply all the electrical energy generated by the solar panels to the electrical network.

Why do solar panels use batteries?

The batteries have the function of supplying electrical energy to the system at the moment when the photovoltaic panels do not generate the necessary electricity. When the solar panels can generate more electricity than the electrical system demands, all the energy demanded is supplied by the panels, and the excess is used to charge the batteries.

How do solar batteries work?

Without a battery, this excess energy typically flows back to the electrical grid. With a solar energy storage system, you can capture and store this surplus energy for use during evenings, cloudy days, or power outages. Understanding how solar batteries work requires knowing how they fit into the broader solar ecosystem:
