Maps with small geographic area blocks, most/all relevant information, and current/recent information are most effective. Geographic area blocks are small.

In jurisdictions like the U.S. and Australia, most customers with solar PV developed their projects under Net Metering, or NET-FITs (see Training Sessions on FITs, Net Metering and NET-FITs)

Zero-rated data transactions for mobile money payments, or energy service providers having alternate options for payment (e.g. offices within communities, payments at selected supermarket till points, etc.)

Although the problems de-scribed here and in the previous section are computationally affordable, distributed implementations leveraging the alter-nate direction method of multipliers are presented ...

Conventional approaches for distributed generation (DG) planning often fall short in addressing operational demands and regional control requirements within distribution networks. To ...

In the context of global efforts to achieve carbon peak and carbon neutrality, the adoption of photovoltaic (PV) systems has surged, transforming energy supply chains worldwide. As a grid enterprise, we ...

Modern payment orchestration platforms allow distributors to offer credit cards, bank transfers, buy-now-pay-later options, and trade credit through a single integration, streamlining operations while ...

The proposed framework for P2PESh in distribution networks, based on the Stackelberg game model and optimized using the EALA, offers a robust and scalable solution for managing ...

To integrate more DERs, new technologies must be identified and grid infrastructure upgraded. Determining upgrades is challenging because of many design considerations. Automated scalable ...

Scalable payment methods for pv distributions

The system is designed for grid-connected industrial sites embedded in distribution networks, where node-level optimization can indirectly support peak reduction, load smoothing and ...
