What is an on grid solar inverter?

An on grid solar inverter is a key component in solar power systems that are connected to the main power grid. Its primary function is to convert the direct current (DC) electricity generated by solar panels into alternating current (AC) electricity, which is compatible with the utility grid.

How does a grid connected solar inverter system work?

When the power generated by the system exceeds the load demand, the excess power can be delivered to the grid, realizing "net metering". Conversely, when the system does not generate enough power to meet the load demand, the required power can be purchased from the grid. Grid-connected solar inverter system have many advantages, including:

How does a solar inverter work?

For safe and reliable integration with the electric grid, the solar inverter must precisely synchronize its AC output with the grid's voltage, frequency, and phase characteristics. This process, known as grid synchronization, is essential for ensuring a stable power flow, preventing equipment damage, and maintaining grid stability.
