The Sun emitted a strong solar flare, peaking at 12:01 a.m. on Dec. 8, 2025. NASA's Solar Dynamics Observatory, which watches the Sun constantly, captured an image of the event.

NASA's latest solar flare, peaking on December 8, 2025, could significantly impact communication, technology, and space missions.

On this page you will find an overview of the strongest solar flares of the year 2025 together with links to more information in our archive and a video (if available) of the event.

We expect the combined share of generation from solar power and wind power to rise from about 18% in 2025 to about 21% in 2027. In our STEO forecast, utility-scale solar is the fastest ...

A powerful X5.1 solar flare on November 11, 2025 triggered the strongest radiation surge in nearly two decades, briefly raising flight-level exposure tenfold. Learn what caused the spike, its ...

A powerful solar flare hit Earth in 2025. Learn how it affects satellites, power grids, and your tech. Stay updated on space weather threats.

The sun produced its strongest solar flare of 2025, an X5.1-class eruption from sunspot AR4274 triggering severe radio disruptions across continents. The major event erupted November ...

On 14 May 2025, the Sun erupted with the biggest flare we've seen all year. From the eastern limb of the Sun - that is, the left side - active sunspot region (AR) 4087 erupted in a huge, ...

Are We Concerned? Even though the chances of a catastrophic solar event in 2025 are real, it is far from being civilization-ending. Scientists declare that though there is no cause for panic, ...

The sun erupted in spectacular fashion this morning (Nov. 11), unleashing a major X5.1-class solar flare, the

# Solar panels will explode in 2025

strongest of 2025 so far and the most intense since October 2024.
