Researchers at Kaunas University of Technology (KTU) have discovered an innovative solution beneath our feet: using soil as an efficient thermal energy storage system.

Effects of the heat injection temperature and initial moisture content on the thermal performance of the BHE are analyzed. The results show that at the first thermal storage stage, the ...

A numerical study was conducted for the thermal behavior of soil heat exchanger-storage systems (SHESs) aimed at reducing the energy consumption of greenhouses.

In this communication, a novel thermal energy storage system for greenhouses is presented. The novel system is based on directly heating a particular mass of soil through the solar power and utilizing .

In this work, a novel heat storage soil wall in greenhouse is proposed, which can convert solar radiation into heat and heat crop canopy air. Unlike active heating systems, the proposed heat ...

Understanding the thermal properties of soil is crucial for various engineering, agricultural, and environmental applications [1]. Thermal collectors and PV panels have been utilised to attain high solar fractions to ...

This energy storage system utilises 4970 m³ of underground soil to store the heat captured by a 500 m² solar collector in non-heating seasons through U-tube heat exchangers.

The influencing factors of solar inter-seasonal soil heat storage are simulated and studied from the perspective of ground temperature change, and the variation law of ground temperature in the heat ...

This study showed that this active solar heating system with soil heat storage is an economic and feasible way to increase soil temperatures in solar greenhouses in cold areas.

For example, solar heating in combination with high temperature storage, e.g., using ducts in the ground, has

Solar soil high temperature heat storage

the potential of becoming an environment friendly and economically competitive ...
